I ran Qwen 7B parameter model on BIRD Mini Dev with 500 questions. First I did it without schema context. This way, I had a result like this:

```
                    simple              moderate            challenging         total
count               148                 250                 102                 500
====================================    EX    ====================================
EX                  3.38                1.20                0.98                1.80
================================================================================================
```

Then I added table definitions, column names and a schema summary. Here is the result for that:

```
(text2sql_env) PS C:\Users\edizk\text2sql_eval\bird> python evaluation/evaluation_ex.py --predicted_sql_path pr
h data/mini_dev_sqlite_gold.sql --db_root_path mini_dev_data/dev_databases/minidev/MINIDEV/dev_databases/ --dif
start calculate EX
                    simple              moderate            challenging         total
count               148                 250                 102                 500
====================================    EX    ====================================
EX                  57.43               32.40               20.59               37.40
================================================================================================
Finished EX evaluation for SQLite on Mini Dev set
```

Terminal prompts to make it work:

1- No Schema Context

python bird_infer.py

python evaluation/evaluation_ex.py --predicted_sql_path predict_mini_dev.json --ground_truth_path data/mini_dev_sqlite_gold.sql --db_root_path mini_dev_data/dev_databases/minidev/MINIDEV/dev_databases/ --diff_json_path data/mini_dev_sqlite.json

2- With Schema Context

python bird_infer_schema.py

python evaluation/evaluation_ex.py --predicted_sql_path predict_mini_dev_schema.json --ground_truth_path data/mini_dev_sqlite_gold.sql --db_root_path mini_dev_data/dev_databases/minidev/MINIDEV/dev_databases/ --diff_json_path data/mini_dev_sqlite.json

3- With fuzzy string and BM25 (vol1)

```
(text2sql_env) PS C:\Users\edizk\text2sql_eval\bird> python evaluation/evaluation_ex.py --predicted_sql
h data/mini_dev_sqlite_gold.sql --db_root_path mini_dev_data/dev_databases/minidev/MINIDEV/dev_database
start calculate EX
                    simple              moderate            challenging         total
count               148                 250                 102                 500
====================================    EX    ====================================
EX                  50.68               30.40               19.61               34.20
================================================================================================
Finished EX evaluation for SQLite on Mini Dev set
```

Lower then schema context but not that bad.

4- With fuzzy string and BM25 (vol2)

```
path data/mini_dev_sqlite_gold.sql --db_root_path mini_dev_data/dev_databases/minidev/MINIDEV/dev
start calculate EX
                    simple              moderate            challenging         total
count               148                 250                 102                 500
====================================    EX    ====================================
EX                  54.73               31.60               24.51               37.00
==========================================================================================
Finished EX evaluation for SQLite on Mini Dev set
```

Better than vol1, but nothing special.This version keeps all of the primary keys regardless of the connection, it also removes column amount restriction (which was 8). Nothing special in terms of accuracy. Restore table bridges.
